■ Connection

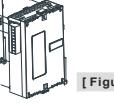

Step 1 Screw open the side cover of the extension unit, and you will see the connection port.

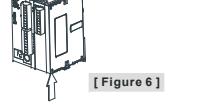

Step 2 Lift the fixing clip by the screwdriver.

Step 3 Adjust the positioning hole of the MPU and the extension unit. Meet the connection port on the MPU with the extension unit to tightly connect the two.

Step 4 Fasten the fixing clip on the extension unit to complete the connection.

■ Installation & Wiring

Install the PLC in an enclosure with sufficient space around it to allow heat dissipation (as shown in the figure below).

How to install DIN rail
DVP-PLC can be secured to a cabinet by using the DIN rail of 35mm in height and 7.5mm in depth. When mounting PLC to the DIN rail, be sure to use the end bracket to stop any side-to-side movement of the PLC and reduce the chance of wires being loose. A small retaining clip is at the bottom of the PLC. To secure PLC to the DIN rail, place the clip onto the rail and gently push it up. To remove it, pull the retaining clip down and gently remove the PLC from the DIN rail.

Wiring
1. Use 22-16AWG (1.5mm) single or multiple core wire on I/O wiring terminals. The specification of the terminal is shown in the figure on the left hand side. The PLC terminal screws shall be tightened to 1.95kg-cm (1.7 in-lbs). Use 65/75°C copper wires only.
2. DO NOT place the I/O signal wires and power supply wire in the same wiring duct.

■ Notes

- DO NOT install PLC in an environment with
 - Dust, smoke, metallic debris, corrosive or flammable gas
 - High temperature, humidity
 - Direct shock and vibration

During the engineering

- DO NOT drop tiny metallic conductor into the PLC when screwing and wiring.
- There should be a margin of more than 50mm between the PLC and other control devices, and the PLC should be placed away from high voltage wire and power equipment.

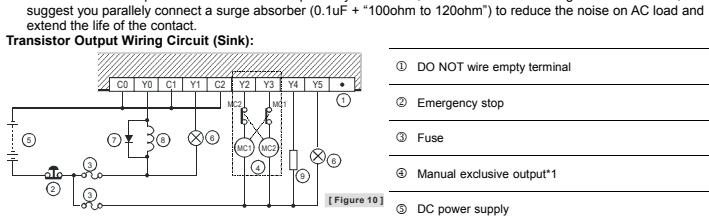

*1: There is no internal protection circuit in the output relay of the PLC; therefore when activating an inductive load, we suggest you parallelly connect a reverse current protection diode to extend the life of the contact.

- The diode has to be able to endure max. 5 ~ 10 times of load voltage.

*2: Manual exclusive output uses external circuit and forms an interlock, together with the PLC internal program, to ensure safety protection in case of any unexpected errors.

*3: There is no internal protection circuit in the output relay of the PLC; therefore when activating an inductive load, we suggest you parallelly connect a surge absorber (0.1μF + 100ohm to 120ohm) to reduce the noise on AC load and extend the life of the contact.
